

## EQUINE TOMOSYNTHESIS

Carpus (B0039, 30 June 2020)

Three years old thoroughbred stallion used for flat racing. Lamé left front 2/5 in May, blocked out to carpal joint. Horse was getting worse in the next few weeks, injection therapy of the carpus without any success. EqueTom tomosynthesis study was performed in June.

**Diagnosis:** Fracture of the accessory carpal bone.

Horse got surgery (arthroscopy) of the carpus and is still in rehabilitation.
