

## EQUINE TOMOSYNTHESIS

Fetlock (P0013, 25 Apr 2019)

The indications for the study of the fetlock joint of the left forelimb by the DTS method were discomfort during the horse's work, positive dynamic tests for the flexion of the fetlock joint, and occasional synovitis.

The images visualize the formation of osteophytes (indicated by arrows) in the dorsal and palmar parts of the distal region of the third metacarpal bone in the focus of the medial condyle and the medial proximal sesamoid bone of the fetlock joint.

**Diagnosis:** fetlock joint arthrosis.
